# CSEN1002 Compilers Lab, Spring Term 2024 Task 4: Context-Free Grammars Epsilon & Unit Rules Elimination

Due: Week starting 09.03.2024

#### 1 Objective

For this task, you will implement the algorithms for eliminating epsilon and unit rules from a given context-free grammar (CFG). Recall that a CFG is a quadruple  $(V, \Sigma, R, S)$  where V and  $\Sigma$  are disjoint alphabets (respectively, containing *variables* and *terminals*),  $R \subseteq V \times (V \cup \Sigma)^*$  is a set of *rules*, and  $S \in V$  is the *start variable*.

#### 2 Requirements

- We make the following assumptions about input CFGs for simplicity.
  - a) The set V of variables consists of upper-case English letters.
  - b) The start variable is the symbol S.
  - c) The set  $\Sigma$  of terminals consists of lower-case English letters (except the letter e).
  - d) The letter "e" represents  $\varepsilon$ .
  - e)  $\varepsilon \notin L(G)$ .
- You should implement a class constructor CfgEpsUnitElim, and three methods; toString, eliminateEpsilonRules, and eliminateUnitRules.
- CfgEpsUnitElim, a class constructor, takes one parameter which is a string description of a CFG and constructs a CFG instance. A string encoding a CFG is of the form V#T#R.
  - V is a string representation of the set of variables; a semicolon-separated sequence of upper-case English letters, starting with S.
  - T is a string representation of the set of terminals; a semicolon-separated sequence of alphabetically sorted lower-case English letters.
  - -R is a string representation of the set of rules. R is a semicolon-separated sequence of pairs. Each pair represents the largest set of rules with the same left-hand side. Pairs are of the form i/j where i is a variable of V and j is a string representation of set of right-hand sides—a comma-separated sequence of lexicographically sorted strings. These pairs are sorted by the common left-hand side i based on the ordering of V.

<sup>&</sup>lt;sup>1</sup>This is also the natural ordering of Strings in java. It is used by Collections.sort(List<String> list) and Arrays.sort(String[] a)

• For example, consider the CFG  $G_1 = (\{S, A, B, C\}, \{a, b, c, d, x\}, R, S)$ , where R is given by the following productions.

This CFG will have the following string encoding.

$$S; A; B; C\#a; b; c; d; x\#S/aAb, xB; A/Bc, C, c, d; B/CACA, e; C/A, b, e$$

- toString returns a string representation of a CFG. This string representation is the same as the one used for the input to the constructor.
- eliminateEpsilonRules eliminates epsilon rules from the constructed CFG using the classical algorithm. For example, after invoking the method on  $G_1$ , the string returned by toString is the following (split for readability)

• eliminateUnitRules eliminates unit rules from the constructed CFG using the classical algorithm. For example, after invoking the method on  $G_1$ , the string returned by toString is the following

$$S;A;B;C#a;b;c;d;x#S/aAb,xB;A/Bc,b,c,d,e;B/CACA,e;C/Bc,b,c,d,e$$

Additionally, the above two methods can be called sequentially. Thus the result of
invoking toString after invoking eliminateEpsilonRules then eliminateUnitRules
returns the following (split for readability)

- Important Details:
  - Your implementation should be done within the template file "CfgEpsUnitElim.java" (uploaded to the CMS).
  - You are not allowed to change package, file, constructor, or method names/signatures.
  - You are allowed to implement as many helper classes/methods within the same file (if needed).
  - Public test cases have been provided on the CMS for you to test your implementation.
  - Please ensure that the public test cases run correctly without modification before coming to the lab to maintain a smooth evaluation process.
  - Private test cases will be uploaded before your session and will have the same structure as the public test cases.

## 3 Evaluation

- Your implementation will be tested on ten CFGs.
  - Three CFGs will test epsilon rule elimination only.
  - Three CFGs will test unit rule elimination only.
  - Four CFGs will test epsilon rule elimination followed by unit rule elimination.
- You get one point for each correct output of toString; hence, a maximum of ten points.
- The evaluation will take place during your lab session of the week starting Saturday, March 09.

### 4 Online Submission

• You should submit your code at the following link.

https://forms.gle/CwhDmpSVK49TYZGSA

- Submit one Java file (CfgEpsUnitElim.java) containing executable code.
- Online submission is due by the end of your lab session.
